ដ	moudsoud	onomethy	lethanola	umine and	ď	phosphomonomethylethanolamine and phosphodimethylethanolamine, the

three methylation steps required to convert phosphoethanolamine, the phosphootoline, wedates a key step in the biosynchesis of choline, a precursor of the comprotectant glycine betaine. Has an optimal pH of 7.8 to 8.5. Has no ethanolamine- or phosphatidylethanolamine-N-methyltransferase activity.

CATALYTIC ACTIVITY: S-adenosyl-L-methionine + ethanolamine phosphate = S-adenosyl-L-methionine + ethanolamine phosphate.

phosphate.

- In STATAM REGULATION: Inhibited by phosphocholine but not by choline, glycine betaine, monomethylethanolamine or dimethylethanolamine.
- GUBUNIT: Monomer.
- GUBUNIT: Monomer.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               phosphate.
SUBCELLULAR LOCATION: Cytoplasmic (By similarity).
SUBCELLULAR LYCATION: Cytoplasmic (By similarity).
SIMILARITY: Belongs to the methyltransferase superfamily.
CAUTION: Ref.1 (AAG51806) sequence differs from that shown due to erroneous gene model prediction.
                                                                                                                                                                                                                                                                                                                                                                                                                                             TRAINE-INCOMENTAL SEQUENCES FROM N.A.

Unpublished observations (WAX-2002).

-I- FUNCTION: Catalyzes N-methylation of phosphoethanolamine,
phosphomonomethylethanolamine and phosphodimethylethanolamine, the
three methylation steps required to convert phosphoethanolamine to
phosphocholine (By similarity).

-I- CATALYITE, ACTIVITY: S-adenosyl-L-methionine + ethanolamine
phosphate = S-adenosyl-L-mocysteine + N-methylethanolamine

SUBCELLUIAN LOCATION: Cytoplasmic (Probable).
SIMILANITY: Belongs to the methyltransferase superfamily.
CAUTION: This protein is a fusion of the two annotated genes
At3917990 and At3918000.
CAUTION: Ref.2 sequence differs from that shown due to erroneous
gene model prediction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ENBL; AR197940; AAG41121.1; -.

The obsymthesis: isolation and identification of the Bacherichia coli

Missing gene. ";

U. Bacteriol. 179:1748-1754(1997).

- I - FUNCTION: Methyltransferase required for the conversion of

dimethylmenaquinone (DMHZ) to menaquinone (MHZ) and the

conversion of 2-polyprenyl-6-methoxy-1,4-benzoquinol (DMMHZ).

C. 1- CATALYTIC ACTIVITY: S-adenosyl-L-hemocystesine + 2-

polyprenyl-3-methyl-6-methoxy-1,4-benzoquinol.

C. T. CATALYTIC ACTIVITY: S-adenosyl-L-hemocystesine + 2-

polyprenyl-3-methyl-6-methoxy-1,4-benzoquinol.

C. T. CATALYTIC ACTIVITY: S-adenosyl-L-hemocystesine + 2-

polyprenyl-3-methyl-6-methoxy-1,4-benzoquinol.

C. T. CATALYTIC ACTIVITY: S-adenosyl-L-hemocystesine + 2-

polyprenyl-3-methyl-6-methosyl-L-hemocystesine + menaquinol.

C. T. PATHWA: Whendulinone biosynthesis; last step.

C. T. PATHWA: Ubiquinone biosynthesis.

C. T. SIMILARITY: Belongs to the ubiE family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Similarity 28.0%; Pred.
